

AI News Summarizer: Complete Study Material

Masterclass conducted by Vinay S Kumar and Prateeksha Acharya

1. Introduction to No-Code Automation

Traditionally, if you wanted computers to talk to each other, you needed to spend years learning complex coding languages. No-code platforms like n8n change this entirely.

They provide a visual canvas where you drag, drop, and connect "nodes" that represent logic. It is like building with LEGO bricks for software—you focus on the logic of the workflow, and the platform handles the underlying technical communication.

2. The Node Glossary

Keep this cheat sheet handy while building your workflow:

- **Schedule Trigger (The Alarm Clock):** Starts your automation automatically at a specific time.
- **RSS Read (The Newsboy):** Fetches the latest published articles from a specific website.
- **HTTP Request (The Digital Waiter):** Communicates with external APIs to fetch live, real-time data from the entire internet.
- **Merge (The Organizer):** Combines separate data streams into one workflow path.
- **Aggregate (The Stapler):** Bundles separate items into one single JSON document so the AI can read it all at once.
- **Gemini AI (The Brain):** Reads your aggregated data, applies your prompt, and writes the clean summary.
- **Gmail Send (The Delivery Person):** Takes the AI's final text and emails it directly to your inbox.

3. Step-by-Step Workflow Guide

Part A: Setting Up the Core Workflow

Step 1: Adding a Schedule Trigger

1. Add a Schedule Trigger node.
2. Set interval to "Every Day".
3. Configure trigger time to "10:00 AM".

Step 2: Fetching News from RSS Feeds

1. Connect an "RSS Read" node to the Schedule Trigger.
2. Name it "AI Updates Feed" and paste the URL: <https://aibusiness.com/rss.xml>
3. Add another "RSS Read" node parallel to the first.
4. Name it "Technology Updates Feed" and paste the URL: <https://techcrunch.com/feed/>

Step 3 & 4: Merging and Aggregating

1. Add a "Merge" node. Set "Number of Inputs" to 2. Connect both RSS nodes to the Merge inputs.
2. Add an "Aggregate" node after the Merge node. Set to "Aggregate All Item Data".

Part B: Fetching Live Events (SERP API)

Step 5 & 6: Add HTTP Request Node & cURL

1. Add an "HTTP Request" node connected to the Schedule Trigger.
2. Go to <https://serpapi.com/google-events-api> and copy the cURL or BASH command.
3. In n8n, click "Import cURL" and paste the command and import.

Step 7 & 8: Query Parameters & Merge Update

1. Update query parameter "q" to: AI Tech Events in india.
2. Add your api_key (It will be filled automatically while importing cURL/BASH).
3. Click your Merge node, change inputs from 2 to 3, and connect this HTTP Request node.

Part C: AI Summarization & Email Delivery

Step 9 & 10 : Add Google Gemini

1. Add a "Basic LLM Chain Node" between Aggregate and Gmail.
2. Drag and drop data from Aggregate node to Basic LLM Chain Node.
3. Paste the following prompt:

```
You are an AI newsletter assistant creating a daily intelligence report from
multiple categories.
Use only the provided items. Do not invent content.
Organize the provided items by category and Format exactly like this:
```

```
Hi there,
Here's your Tech Brief:
```

```
AI NEWS HIGHLIGHTS
=====
```

```
[5 most important AI developments]
For each AI-related item, output:
HEADLINE IN ALL CAPS
Summary in 1-2 sentences.
Link: <paste link>
```

```
TECHNOLOGY UPDATES
=====
```

```
[Latest broader technology-related developments from major tech sources]
For each broader technology-related item, output:
HEADLINE IN ALL CAPS
Summary in 1-2 sentences.
```

Link: <paste link>

UPCOMING AI EVENTS

=====

[List events with date, location, description]

If no events found: "No AI events scheduled this week"

For each Event Item

HEADLINE IN ALL CAPS

Summary in 1-2 sentences.

Link: <paste link>

Keep the summaries professional, concise, and easy to read.

Sign off as "Your AI Intelligence Team"

4. Add a Google Gemini Chat Model node.

5. Go to <https://aistudio.google.com/api-keys>, create and copy API key.

6. Create Credential "Google Gemini Chat Model" and Select (gemini-2.5-flash).

Step 12 : Connect Gmail

1. Add a Gmail Send node.

2. Click "Create New Credential" and use the "Sign in with Google" button to grant permissions.

3. Set To: [Your Email], Subject: "Today's AI News", and Message: {{ \$json.text }}.

Step 13: Test and Deploy

1. Click "Execute Workflow", verify your email, and toggle the workflow to Active!
